

Medicinal Chemistry (CHEM 315/515)

Guidelines for Literature Article selection for Paper Assignment

1. The article should be from the primary scientific literature which means there should be new experimental results described. A secondary literature article, which is a review/summary of a selection of primary literature articles, may be used to inform your paper by providing a context, but it should not be the focus of your paper.
2. The *Journal of Medicinal Chemistry* or *ACS Medicinal Chemistry Letters* is not the only source for articles describing drug development. There are a variety of good journals that describe new drug development. A partial list of other journals that communicate drug development research includes: *Science*, *Nature*, *Journal of the American Chemical Society*, *Biochemistry*, *Journal of Biological Chemistry*, *Journal of Molecular Biology*, and *Angewandte Chemie International Edition*.
3. Your literature article may describe any stage of the drug development process, but should not be too clinical, nor too synthetic, in nature, i.e. some chemistry and biochemistry should be described, not just results of patient studies or simply a total synthesis of a biologically active molecule. A selection of papers is listed below to assist you. You do not need to choose one of these articles, but they are provided as examples and possible selections. References in these articles are another source of literature article.

Guidelines for Writing the Paper Assignment

1. Your paper should be a 3-5 page summary of the research described in the literature article.
2. Please refrain from quoting your article. You should use your own words and descriptions as much as possible.
3. Along with a description of the research, you should attempt to be critical in your analysis of the literature article. Does the data presented in the article support the conclusions that are reported? Are the conclusions supported by the data that is presented in figures or tables? Are there other experiments that should have been done? A good paper will address these issues and will support answers to these questions with brief explanations.
4. Graduate students taking the 515 course must select two articles in the same area and compare and contrast the articles and reported research. Again, a review article may be used to assist in understanding the field, but the two articles for the paper must be from the primary literature.
5. You must let me know of your paper selection by Thurs., Oct. 7. Your paper will be due in class on Thurs., Nov. 4. More than one student can review a particular paper but your analysis and writing must be independent.

Selection of Potential articles

Topic	Article Link
antibiotics/bacterial resistance	<ol style="list-style-type: none"> <li data-bbox="646 317 1385 422">1. “Bacterial charity work leads to population-wide resistance” Henry H. Lee, Michael N. Molla, Charles R. Cantor & James J.
